

DNS resolution time :

Five high-traffic websites get an average of ten resolution times through three different DNS resolvers. Where My DNS is 5x the runtime of the other two. One of the possible reasons is (1). My DNS may not contact the nearest resolver. (2). Local DNS and Google's public DNS will have faster channels to obtain resolution information. (3). My DNS is the data transmission through the python interface, Local DNS and Google's public DNS may use C language or machine language for faster computation. (4). My DNS is not cached.
